

```
boost::statechart::  
event< EvTopicMessage  
< TSource, TOrthogonal,  
typename TSource::TMessageType > >
```

The diagram shows a class hierarchy. The base class, `boost::statechart::event< EvTopicMessage< TSource, TOrthogonal, typename TSource::TMessageType > >`, is represented by a white box with a black border. It has two empty rectangular compartments below the header. The derived class, `smacc2::default_events::EvTopicMessage< TSource, TOrthogonal, TMessageType >`, is represented by a gray box. It has a header compartment and two data member compartments below it. A blue arrow with an open triangular head points from the derived class to the base class, indicating inheritance.

```
smacc2::default_events  
::EvTopicMessage< TSource,  
TOrthogonal, TMessageType >
```

```
+   msgData
```

```
+   getEventLabel()
```
